

## Ans Composting

It is an aerobic, biological process which uses naturally occurring microorganisms to convert biodegradable organic matter into human-like product.

\* Composting is the biological reclamation of organic materials by natural decomposition process.

\* Ex - decay of fallen leaves in forests, decay of wood in a stand & animal carcasses decay in a preserve.

One conversion technology category is thermal conversion using heat with or without oxygen, to turn biomass into energy like liquid fuel & chemical feedstocks. Included are pyrolytic gasification & combustion.
