

Section-1

Ans 1 Output design :- Computer output is the most important and direct source of information to the user. A major form of output is a hard copy from the printer. Printout should be design around the output requirement of the user.

media device are available for providing computer based output:-

1. MICR readers
2. Line matrix and daisy wheel
3. computer output microfilm
4. CRT screen display
5. Graph plotter.

Control design :- The process of operation control is highly dependent upon formal MIS. Efficient and effective information processing is essential since control are typically numerous data is monitoring is

constants and response is frequent over time.

The immediacy of control demands reliability the data intensity demands efficiency and the data scale demands control and disciplines.

user interface! - design :- A system should be defined by the its boundaries that limits and identifies its components process and their relationship when it interface with another system.

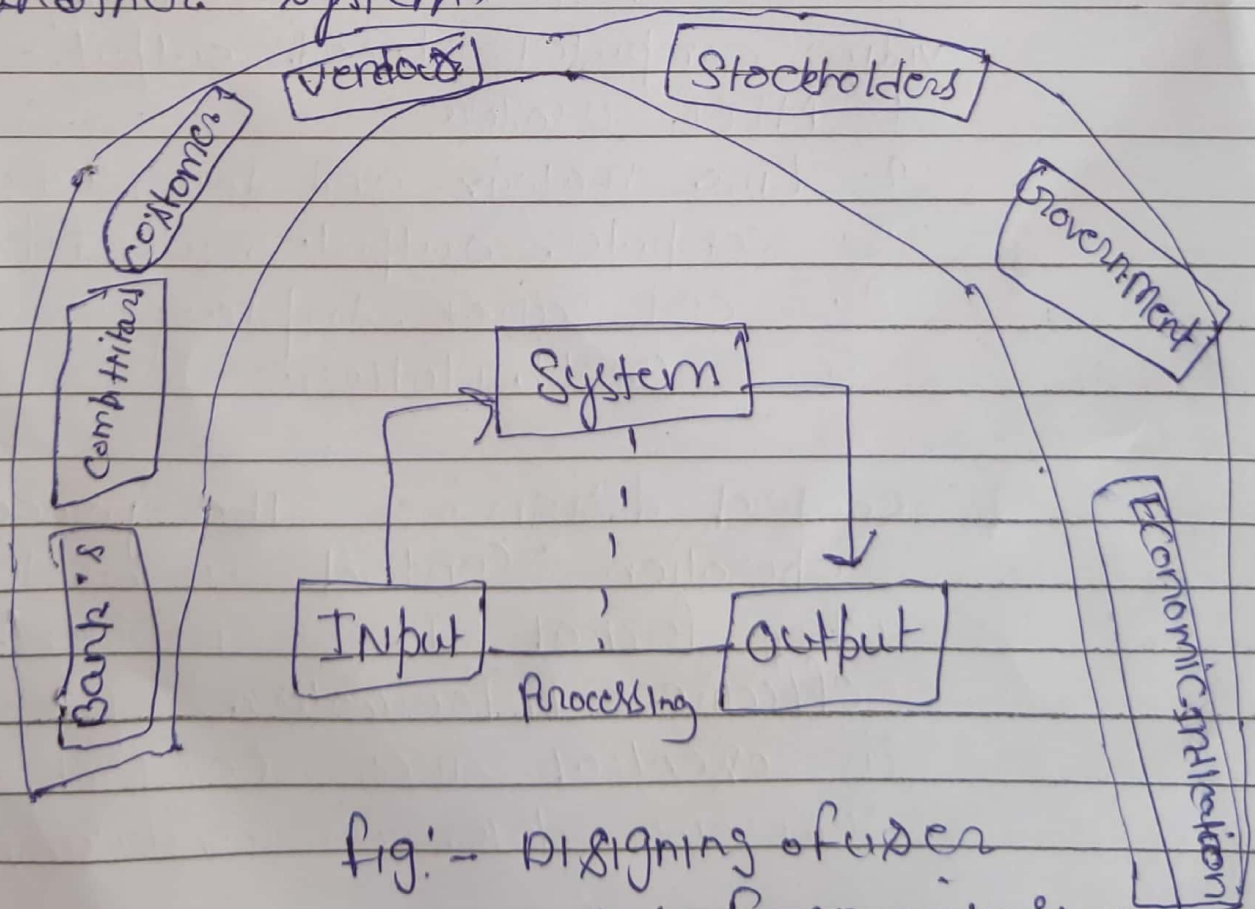

Fig: - Designing of user interface with system.

Prototyping :-

There are two major problems for building information system.

1. System development life cycle task too long
2. An accurate system is rarely developed the first time
