

Section-2

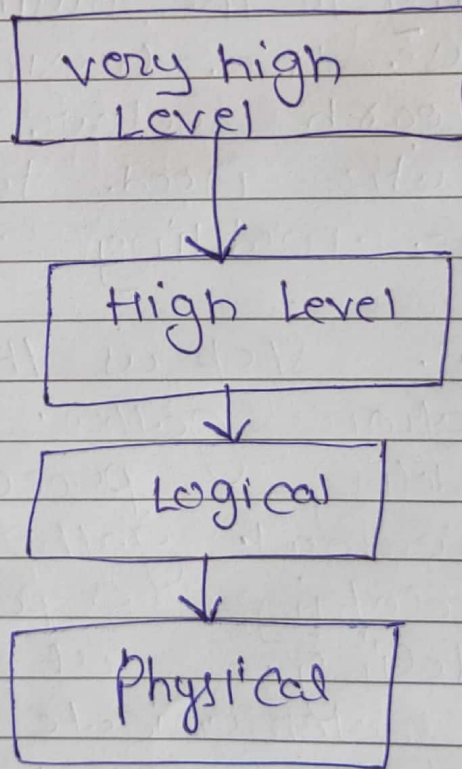

Ans 2 A data model is a description of how data should be used to meet the requirement given by the user. Data modeling helps to understand the Information requirement. Data modeling differs according to the business process because the business processes are different in each sector and its need to be identified in the modeling stage.

Initial step is the analysing the situation gather data. Data modeling process starts with requirement gathering, when developing a proper data modeling, it is important to communicate with the stakeholders about the requirement.

Data modeling is the act of exploring the data oriented structure.

Level of Data modeling :-

There are four level of data modeling.
