Process Modelling

The Business process modelling is a major factor for an organization in order to understand and develop the activities and information to be used to accomplish its business goals. Processes may be analysed or improved using BPM, normally performed by business analysts. Requirement analysis is critical for success in a project as, if the stakeholders do not pay the proper attention required to the problem, may cause a project to fail.

2) Information Requirement Analysis (IRA)

Information Requirement Analysis is an information analysis methodology where the objective is to find the documents needed to carry out a process or an activity in a business model. IRA objective is to serve as a tool for information systems development, particularly within the requirements engineering phase.

IRA includes following steps: Design of a business model, design of an information model, design of a mapping of information model to the business process, criticality evaluation of the documents, and finally a ranking of the document.
