Ans. The Internet Architecture is based on a simple idea: ask all networks want to be part of carrying a single packet type, a specific format that the IP protocol. The user who wishes to make an this internetwork must store its data in IP packets that are delivered to the first network to cross.

The major difference from an extranet, however, is that an intranet is used internally. While an extranet allows business to communicate with clients and vendors, an intranet allows employees and colleagues to work together in a virtual space - no outside parties are involved.
