

Column Head: Column head is a bracket on top of column or an enlarged cross section of column at its top on which other structural members can rest. It provides additional base area (more than that of column) cross sectional area which serves as a base to other structural members.

Drop: A projection below the slab used to reduce the amount of negative reinforcement over a column or the minimum required slab thickness, and to increase the slab shear strength.

Drop panel is a thickened portion of flat slab column to resist shear of flat slab. It doesn't support any other structural member.

Column head is a bracket on top of column or an enlarged cross section of column ~~or an~~ at its top on which other structural members can rest. It provides additional base area (more than that of column ~~base~~ cross sectional area) which serves as a base to other structural members.
