### B-spline

- = The B-spline curves are specified by a function that has a limited flexibility.
- These curves can be used to construct blending curves.
- The curves resulted by the use of open uniform basis function are nearly like Bezier curves.

### Bezier

The Bezier curves can be specified with boundary conditions, with a characterizing matrix or with blending function.

Bezier curves are found in printing & drawing packages as well as CAD system.

The curve generally follows the shape of defining polygon.
