

Application Security -

It is the process of developing, adding & testing security features within applications to prevent security vulnerabilities against threats such as unauthorized access & modification.

Components of information system -

(i) Computer Hardware -

Physical equipments used for i/p, o/p & processing. It depends upon type of organisation.

(ii) Computer Software -

The programs used to control and coordinate the hardware components. It also used for analyzing the data.

(iii) Telecommunication -

It connects the hardware to form a network. A network can be designed to tie together computers in a specific area.

(iv) Database -

This component is where the 'material' that the other components work with resides. A database is a place where data is collected & from which it can be retrieved by using it.

(v) Human resources & procedure -

It is most important component. Man power is required to run & manage the ~~man~~ system.
