

## Section - 4

Ans - (2)

Transducer is a device which converts one form of energy into another form of energy. It is used to measure the physical quantity and convert it into an electrical signal which can be measured by the measuring instrument.

Examples of transducers are: strain gauge, potentiometer, thermocouple, etc.

The transducer is used to measure the physical quantity and convert it into an electrical signal which can be measured by the measuring instrument.

The transducer is used to measure the physical quantity and convert it into an electrical signal which can be measured by the measuring instrument.
