

pg Mass production:-

Mass production and batch production are more or less the same.

But one big difference is, batch production is limited to several hundred of products at a time, for example:

A batch of cookies or biscuits, also books, magazines and likewise mass products at a time.

This usually is a large scale operation that involves large machinery and the products pass through several stages during production.

⇒ Batch production:-

So the batch production. Explain with example, let consider u have a company for ~~manufacture~~ MFG. if other company contract with u for only some quantity of jobs like u have to make only 100 screw then other 2000 bolts. for that company so its fixed the pattern of work ~~but~~ ~~stop~~ you are just have a batch only and produce that work and give to it. In batch production the variety of job are different and change every time.
