

Section-4

Ans-1 Procedural design technique in software design methodology:-

Procedural design (also called component level design) occurs after data architectural and interface designs have been established.

A software design method should be described in terms of

2) Representation part

2) Process Part

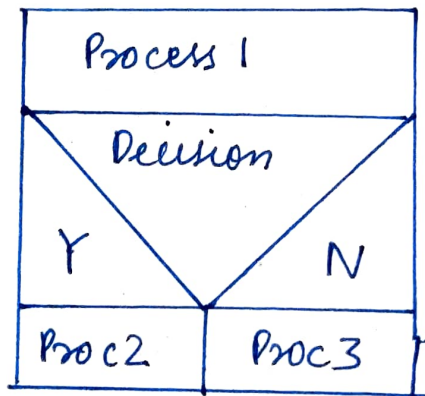

2) Set of heuristics or cliches.

There are two procedural design techniques:-

=> Graphical design Notation

=> Tabular design Notation

=> Program design language

Example of N-S diagram.
