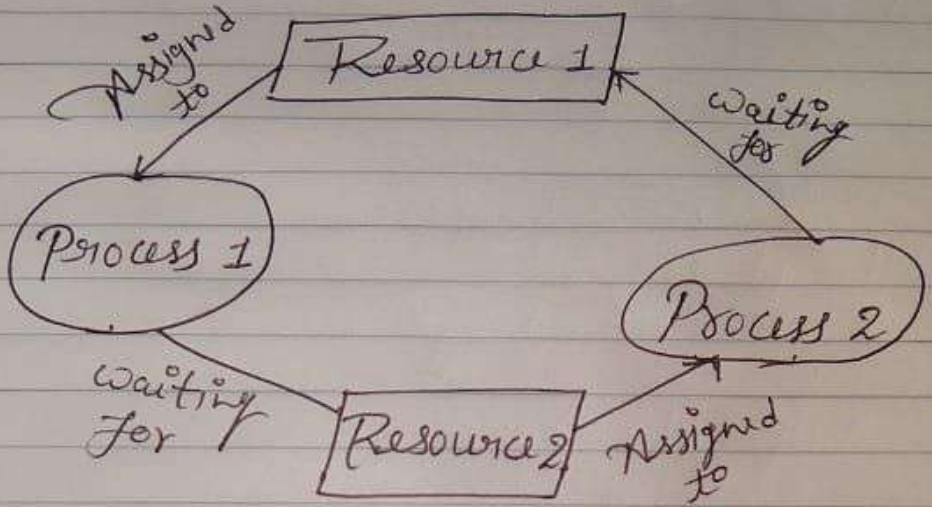
Q.3 Explain Dead look Recovery. Critical evalute the most
Selectively restart processes from a previous checkpoint i.e before it claned any resource. difficult to achieve - sometimes impossible
Successively withdraw resource from a process and given to another process until deadlock is broken.



Massage passing model allows multiple process to read and write data to the message queue without being connected to each other. Massage are stored on the queue until their recipient retrive them. Massage queues are quite useful for interprocess communication and are used by most operating.

Method of interprocess communication.

- pipes - This allows flow of data in one direct
- Name - This is a pipe with specific name it can
- Sockets -
- Shared memory -
- Sockets
