

# Industry

*Cement factories are part of the manufacturing industry. This factory is in Malmö, Sweden.*

An **industry** is a sector that produces goods or related services within an economy.<sup>[1]</sup> The major source of revenue of a group or company is an indicator of what industry it should be classified in.<sup>[2]</sup> When a large corporate group has multiple sources of revenue generation, it is considered to be working in different industries. The manufacturing industry became a key sector of production and labour in European and North American countries during the Industrial Revolution, upsetting previous mercantile and feudal economies. This came through many successive rapid advances in technology, such as the development of steam power and the production of steel and coal.

Following the Industrial Revolution, possibly a third of the economic output came from manufacturing industries. Many developed countries and many developing/semi-developed countries (China, India etc.) depend significantly on manufacturing industry.

## History

### **Slavery**

E..

Slavery, the practice of utilizing forced labor to produce goods<sup>[3]</sup> and services, has occurred since antiquity throughout the world as a means of low-cost production. It typically produces goods for which profit depends on economies of scale, especially those for which labor was simple and easy to supervise.<sup>[4]</sup> International law has declared slavery illegal.<sup>[5]</sup>

### **Guilds**

E..

Guilds, associations of artisans and merchants, oversee the production and distribution of a particular good. Guilds have their roots in the Roman Empire as *collegia* (singular: *collegium*) Membership in these early guilds was voluntary. The Roman *collegia* did not survive the fall of Rome.<sup>[6]</sup> In the early middle ages, guilds once again began to emerge in Europe, reaching a degree of maturity by the beginning of the 14th century.<sup>[7]</sup> While few guilds

remain today, some modern labor structures resemble those of traditional guilds.<sup>[8]</sup> Other guilds, such as the SAG-AFTRA act as trade unions rather than as classical guilds. Professor Sheilagh Ogilvie claims that guilds negatively affected quality, skills, and innovation in areas where they were present.<sup>[9]</sup>

## Industrial Revolution

E...

The industrial revolution (from the mid-18th century to the mid-19th century) saw the development and popularization of mechanized means of production as a replacement for hand production.<sup>[10]</sup> The industrial revolution played a role in the abolition of slavery in Europe and in North America.<sup>[11]</sup>

## Since the Industrial Revolution

E...

This section needs expansion.

[Learn more](#)

In a process dubbed *tertiarization*, the economic preponderance of primary and secondary industries has declined in recent centuries relative to the rising importance of tertiary industry,<sup>[12][13]</sup> resulting in the post-industrial economy. Specialization in industry<sup>[14]</sup> and in the classification of industry has also occurred. Thus (for example) a record producer might claim to speak on behalf of the Japanese

rock industry, the recording industry, the music industry or the entertainment industry. - and any formulation will sound grandiose and weighty.

## Industrial development

---

*Optimized logistics have enabled the rapid development of industry. Here is a thermal oxidizer during the industrial shipping process.*

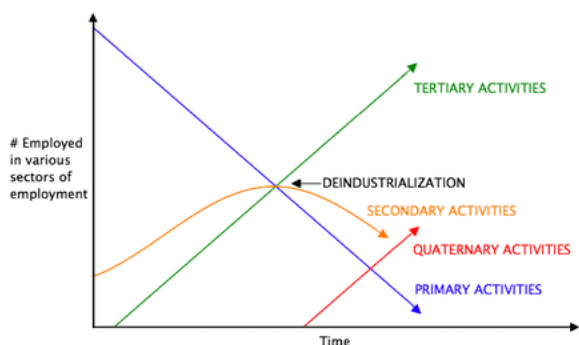

*A factory, a traditional symbol of the industrial development (a cement factory in Kunda, Estonia)*

The Industrial Revolution led to the development of factories for large-scale production with consequent changes in society.<sup>[15]</sup> Originally the factories were steam-powered, but later transitioned to electricity once an electrical grid was developed. The mechanized assembly line was introduced to assemble parts in a repeatable

fashion, with individual workers performing specific steps during the process. This led to significant increases in efficiency, lowering the cost of the end process. Later automation was increasingly used to replace human operators. This process has accelerated with the development of the computer and the robot.

## Deindustrialisation

*Colin Clark's sector model of an economy undergoing technological change. In later stages, the Quaternary sector of the economy grows.*

Historically certain manufacturing industries have gone into a decline due to various economic factors, including the development of replacement technology or the loss of competitive advantage. An example of the former is the decline in carriage manufacturing when the automobile was mass-produced.

A recent trend has been the migration of prosperous, industrialized nations towards a post-industrial society. This is manifested by an

increase in the service sector at the expense of manufacturing, and the development of an information-based economy, the so-called informational revolution. In a post-industrial society, manufacturers relocate to more profitable locations through a process of off-shoring.

Measurements of manufacturing industries outputs and economic effect are not historically stable. Traditionally, success has been measured in the number of jobs created. The reduced number of employees in the manufacturing sector has been assumed to result from a decline in the competitiveness of the sector, or the introduction of the lean manufacturing process.

Related to this change is the upgrading of the quality of the product being manufactured. While it is possible to produce a low-technology product with low-skill labour, the ability to manufacture high-technology products well is dependent on a highly skilled staff.

## Society

An industrial society is a society driven by the use of technology to enable mass production, supporting a large population with a high capacity for division of labour. Today, industry is an important part of most societies and nations. A government must have some kind

of industrial policy, regulating industrial placement, industrial pollution, financing and industrial labour.

## Industrial labour

*An industrial worker amidst heavy steel components (KINEX BEARINGS, Bytča, Slovakia, c. 1995–2000)*

In an industrial society, industry employs a major part of the population. This occurs typically in the manufacturing sector. A labour union is an organization of workers who have banded together to achieve common goals in key areas such as wages, hours, and other working conditions. The trade union, through its leadership, bargains with the employer on behalf of union members (rank and file members) and negotiates labour contracts with employers. This movement first rose among industrial workers.

## War

*The assembly plant of the Bell Aircraft Corporation (Wheatfield, New York, United States, 1944) producing P-39 Airacobra fighters*

The Industrial Revolution changed warfare, with mass-produced weaponry and supplies, machine-powered transportation, mobilization, the total war concept and weapons of mass destruction. Early instances of industrial warfare were the Crimean War and the American Civil War, but its full potential showed during the world wars. See also military-industrial complex, arms industries, military industry and modern warfare.

List of countries by industrial output

**20 largest Countries by Industrial Output (in nominal terms)  
according to the IMF and CIA World Factbook, at peak level as of  
2018**

"[...] a cognitive basis of any kind had to be at least approximately defined before the rising modern professions could negotiate cognitive exclusiveness – that is, before they could convincingly establish a teaching monopoly on their specific tools and techniques, while claiming absolute superiority for them. The proved institutional mechanisms for this negotiation were the license, the qualifying examination, the diploma, and formal training in a common curriculum. The typical institutions that administered these devices were, first, the guild-like professional association, and later the professional school, which superseded the association in effectiveness. [...] Obviously, none of this was in itself an organizational invention. The guilds of merchants that sprang up in eleventh-century Europe were also voluntary associations tending towards the monopolistic control of a new form of trade.[...]"*
