

Safety of Employee

Safety of worker refers to the provision of a safe environment, safe equipment and safe procedures in the workplace in order to ensure worker's health and safety.

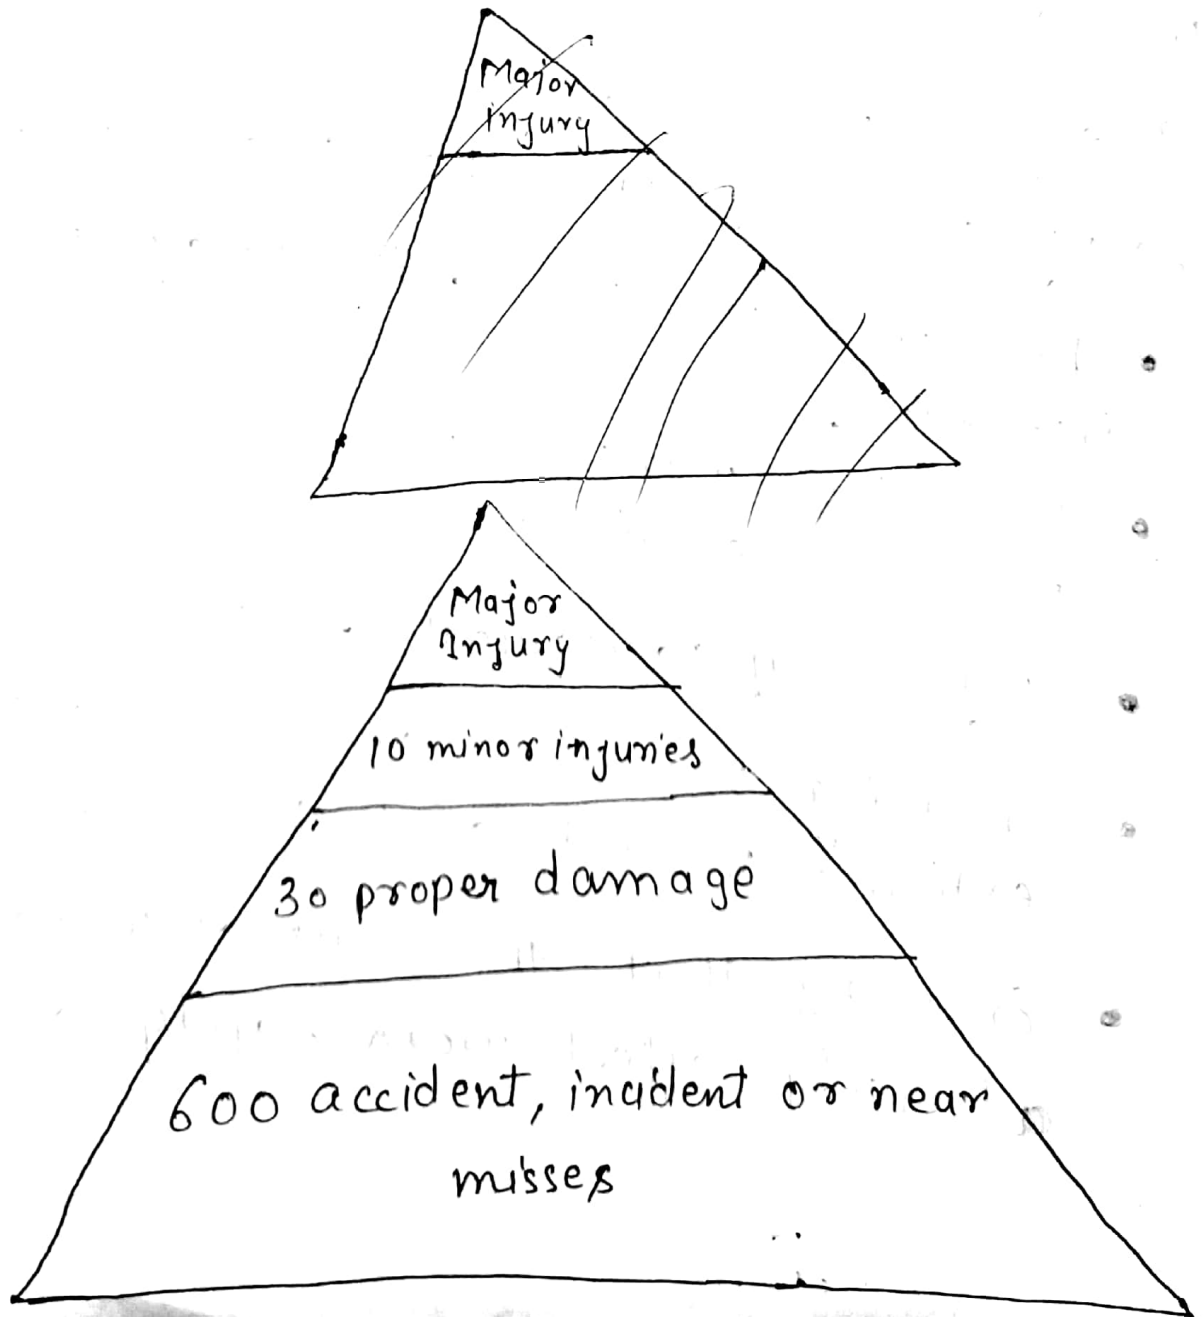

Safety of worker may also be known as worker safety or occupational health and safety.

- Providing workers with safety training and instruction.
- Providing workers with proper personal protective equipment.
- Setting up adequate safety supervision
- Ensuring workers are not subjected to extreme mental and physical fatigue.
- Ensuring that the hours of work do not adversely affect work safety and health

Safety Disrupted

(1) Risk and Control as imagined vs work as done :-

The most organisation is that unless the specific risk, inherent in the day to day activities of the organisation, have been eliminated or managed to an acceptable level then HSMS and compliance based ~~eliminated or managed~~ activity will not be enough to prevent a serious accident.

② Predictive Health and Safety Analytics

A second disrupter is data, and in particular the use of predictive health and safety analytics. Advances in machine learning AI and basic processing power offer a significant opportunity for organisations to create lead and positive indicators as well as target their health and safety resources.

③ Blockchain

The last disruption on the horizon I will speak is the future potential opportunity to leverage blockchain technology to drive cooperation.
